AUTHOR: Kashanin, R.

TITLE: Mean astronomical refraction

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 2, 1962, 17,  
abstract 2A163 ("Glas. Srpska AN", 1958, v. 232, 1-8, Serbo-Croatian,  
French summary)

TEXT: Analyzing the integral of refraction and restricting to zenith  
distances under  $80^{\circ}$ , the author derives a simple and convenient formula for  
mean refraction (for  $\psi = 45^{\circ}$ , to  $\approx 0^{\circ}\text{C}$ ,  $B = 760 \text{ mm}$ ):

$$R(z) = A_0 \operatorname{tg} f(z); \quad \sin f(z) = A_1 \sin z - A_2 \sin 2z$$

where  $A_0 = 60''41$ ;  $A_1 = 0.99962$ ;  $A_2 = 0.00197$ . The latest data on the density  
of the atmosphere upper layers, obtained by means of rocket investigations, were  
used in the study. X

112. New Air-Sampling Apparatus Evaluated

"The Problem of Methods of Collecting Samples of Air for Bacteriological Analyses," by V. S. Kiktenko, I. Kh. Ashurova, V. D. Kucherenko, and N. I. Kashanova, Voyenno-Meditsinskiy Zhurnal, No 11, Nov 56, pp 50-54

The article discusses insufficiencies inherent in the construction of air-sampling devices currently in use, particularly the S. S. Rechmenskiy apparatus. It is considered that the greatest possibilities for collecting bacteria, viruses, rickettsiae, and toxins are afforded by devices which operate on the basis of air filtration through liquid or dry (soluble or insoluble) filters.

A new apparatus, illustrated in Figure 1 [Photo No 270559], for collecting air samples for bacteriological analysis is described. Briefly, the apparatus consists of a U-shaped glass tube 25 cm long with a diameter of 1.5 cm, connected by a short rubber tube to an inverted 250 ml bottle 14 cm deep and 6.5 cm in diameter. The bottle has a spigot at the bottom with an opening of 1.5 cm. The assembled apparatus makes it possible to connect vessels of varying diameter and volume. The tube and part of the bottle are filled with glass beads; 40 ml of physiological solution of bouillon (peptone water) is poured into the apparatus. A rubber tube 30-40 cm long is attached to the tube at the bottom of the bottle, and air is filtered

through the liquid by an aspirator attached to the opening of this tube. Inclusion of the beads in the system provides greater surface for aerosol adsorption, thus accelerating the process considerably.

Experiments with the above-described apparatus showed that the use of bouillon or peptone water increased the collecting capacity of the apparatus. After filtration of the air, the fluid was poured into a glass container and investigated by usual methods depending on the situation. It is noted that any test can be performed with 30 ml of liquid, including biological tests on animals.

The article mentions that an ordinary pump [Photo No 270560] can be used for aspiration of the air (in addition to aspiration by mouth). If the test is carried out in an infected atmosphere, the apparatus can be connected to the inhalation valve of a gas mask. Volume of air aspirated is calculated according to the usual method, described in the text. On completion of the experiments, the accuracy of the calculations was verified by special tests in which a gasometer was used.

The authors discuss preliminary experiments in which the collecting capacities of the Pasteur flask, the Koch method, and the apparatuses of Krotov, Rechmenskiy, and D'yakanov were comparatively evaluated. They state that performance identical with that of the proposed apparatus can be obtained only by the use of the last mentioned device. It was established in these tests that the apparatus proposed collects two-three times more saprophytic microflora than the D'yakanov apparatus. Testing of the remaining devices was limited to trapping specific microflora in the air; intestinal bacilli, dispersed in an aerosol chamber by means of a special atomizer, was used as an experimental subject. The method used in these experiments, the results of which are presented in a table, is described in detail. The capacity of the new apparatus to collect intestinal bacilli was shown to be 2.8 times higher than that of the D'yakanov apparatus. The rate of aspiration of air by the new apparatus is almost ten times greater (480 liters per hour) than that of the D'yakanov apparatus (50 liters per hour). Despite this fact (the collecting capacity of an apparatus supposedly being inversely proportional to the rate of aspiration), the collecting capacity of the new apparatus is higher than that of the D'yakanov system.

It is concluded on the basis of statistical calculations that there exists complete correlation between the experimental data collected in testing the apparatuses, the coefficient of correlation being + 0.97. The authors consider that the higher coefficient obtained in the experiments described correctly reflects the great efficiency of the proposed apparatus. This apparatus is recommended for collecting air samples for bacteriological investigations in hospitals and field bacteriological laboratories. (U)

✓

This article describes serological and microbiological investigations to identify the reservoir of leptospirosis on Sakhalin Island. Two tables show, respectively, results of the examination of 163 sera from cattle; and the agglutination-lysis reaction between immune rabbit sera and Leptospira strains Hund Berlin, No 14, calves 660 and 705. On the basis of the results presented, it was concluded that cattle on Sakhalin are the reservoir of Leptospira of the type hund Berlin, vitulina (grippe-typosa) and akiyami B. Infection of cattle with leptospiroses of the canicola type occurred on Sakhalin chiefly via water sources from dogs and gray rats, the principal carriers.

AUTHORS: Kashapov, S. and Sharifullin, Sh., Electricians

TITLE: Oil Well Gas Should be Used to Operate the Diaphragm Mechanism  
(Dlya membrannogo mekhanizma ispol'zuyem poputnyy gaz)

PERIODICAL: Neftyanik, 1958, Nr 7, p 22 (USSR)

ABSTRACT: The authors state that the SAT-2 KB NP remote control automatic system offers the possibility of measuring oil well output from the office of a dispatcher. However, gate valves and transducers of the AO-1 type used in this system are not always available. For this reason the authors recommend the use of an MIM device instead of a gate valve. The MIM device is a directly functioning mechanism provided with a diaphragm. In this system the oil well gas from oil traps, coming out under 2 atm. pressure, is used to shut off the MIM. In order to measure the free flow of petroleum an RVZ relay is connected with a solenoid which opens the access to the MIM. When the measuring vessel is filled up, the RVZ relay switches on, while the recorder at the dispatcher office switches off. This suggestion by the authors has been accepted at the No. 2 oilfield of the Bavlyneft' Administration.

TITLE: Vapor Phase Purification of Benzole from Sulphurous Compounds in a Stream of Coke Oven Gas with a Fluidized Bed Purifying Agent

PERIODICAL: Koks i Khimika, 1959, Nr. 10, pp. 49-50 (USSR)

ABSTRACT: Purification of benzole from sulphuric compounds by passing it through a fluidized bed of coke oven gas activated Karlovsky No. 5 or Karlovsky No. 6 at a temperature of 400-500°C. was investigated on a laboratory scale apparatus (116). Activation of the ore consisted of a treatment with sodium hydroxide and subsequent reduction to Fe and FeO in a stream of coke oven gas. The consumption of sodium hydroxide amounted to 7% of the weight of the ore. The results obtained are given in the table. For comparison, purification of benzole in a stream of pure hydrogen was also carried out (results are given in the table). It was found that purification of benzole from carbon disulphide takes place easily, while

thiophene a longer contact time with the purifying mass is necessary. The required degree of purity of benzole for synthetic purposes could be obtained in the laboratory apparatus by repeated passage through the fluidized bed until a total contact time of 0.4 sec. is obtained. There was no material difference between the degree of purification of benzole in a stream of pure nitrogen or coke oven gas. Purifying properties of the contact mass can be regenerated by oxidation of a stream of air and steam at a temperature of 300-400°C and subsequent reduction in a stream of coke oven gas.

Problemy krasnogo turbogeneratorestroyeniya (Problems of Building Large Turbo-generators) Moscow, Izd-vo AN SSSR, 1960. 73 p. 3,500 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Institut elektromekhaniki.

Ed.: I. D. Urazov; Ed. of Publishing House: A. A. Chizhov; Tech. Ed.: N. A. Kruglikova.

PURPOSE: This booklet is intended for engineers and scientists.

COVERAGE: The problems discussed in the booklet refer in considerable degree, to the machinery of tomorrow. Thus, the authors have had to base their work on data from design and research projects. They set out some basic trends in the development of turbogenerator manufacturing and indicate the course for further research and development. Chapters I and II were written by V. P. Anemopodistov, chapter III by E. G. Kasharskiy, chapter V and VI by

TITLE: Calculation of transients in the electrical machines with nonsalient-pole rotors

SOURCE: AN SSSR. Izvestiya. Energetika i transport, no. 5, 1965, 84-90

TOPIC TAGS: synchronous machine, synchronous machine transient

ABSTRACT: A method of calculation of transients in cylindrical-solid-rotor synchronous machines to whose stator a voltage is suddenly applied (G. Concordia and H. Poritsky, Engg, 1937, 56) is further developed. Formulas for the transient currents in a polyphase machine with unwound solid cylindrical rotor are derived. The transients in a wound-rotor machine are considered, and corresponding formulas are derived for these cases: (a) application of a unit voltage to the stator winding, (b) application of a unit voltage to the rotor winding with open and closed stator circuit; (c) sudden short-circuit at the stator winding terminals. The use of the formulas is illustrated by a numerical example ("experimental results were supplied by A. M. Volkov, calculations were performed by L. A. Smirnova"). Orig. art. has: 4 figures and 36 formulas.
